Education

Virginia Tech

Expected: 2027

B.S. Major: Computer Science

Relevant Coursework: Introduction to Software Design, Software Design and Data Structures, Intro to Problem Solving in CS, Computer Organization I and II, Data Structures and Algorithms

Extracurriculars: Computer Science Careers at Virginia Tech, Data Structures and Algorithms Club

Technical Skills

Languages: C/C++, C#, Java, Python, JavaScript, TypeScript, HTML/CSS, Swift, SQL, Bash

Frameworks: Django, React.js, AngularJS, Express.js, Node.js, Vue

Developer Tools: Git, Unix/Linux Command Line, Vim, Figma, Firebase, MongoDB, RESTful APIs, JSON

Experience

Full Stack Developer Intern

Sept 2024 – Dec 2024

Engauge

- Developed and deployed responsive front-end user interfaces for a large-scale platform, aligning with design mockups to enhance user experience, later deployed into classrooms for real-world usage and improved engagement by 30%.
- Built and optimized scalable backend systems using Firebase and Google Cloud services, solving performance bottlenecks and improving data flow based on classroom usage feedback.
- Applied collaborative and technical problem-solving skills to improve cross-functional functionality, debugging features and iterating on feedback to boost platform usability by 25%.

Projects

LocksAI | MongoDB, Express.js, Node.js, Django, Scikit-learn

- Developed an AI-powered sports betting assistant that delivers personalized game picks and predictions using the **OpenAI API** and **Scikit-learn** for machine learning-based analysis.
- Designed and built a robust backend with **Django** and **Node.js**, utilizing **RESTful APIs**, **MongoDB**, and **Express.js** for user authentication, data management, and real-time updates.
- Implemented a responsive user interface with Tailwind CSS, enabling seamless interaction for users accessing betting picks, arbitrage opportunities, and sports data in real time.

LiftIn | MongoDB, Express.js, React.js, Node.js

- Developed a **MERN stack** social media iOS app with blog-like features and full **CRUD** functionality, enabling users to post, edit, delete, and track gym videos, PRs, progress pics, and fitness milestones.
- Implemented secure user authentication with account creation, profile customization (e.g., profile picture, maxes, weight, height, age), and session management.
- Designed and deployed a RESTful API using **AWS Elastic Beanstalk** as a platform service for managing backend infrastructure, and utilized **Amazon S3** for scalable storage of user-uploaded media content.

Posturite; HooHacks | OpenCV, MediaPipe, Tkinter

- Designed and developed a desktop application in 24 hours that analyzes user posture and provides real-time feedback using body landmark detection.
- Utilized **OpenCV** and **MediaPipe** to calculate distances and angles between key body landmarks for posture classification.
- Demonstrated real-time problem solving under pressure by debugging inaccurate pose detection and implementing fallback calculations during the hackathon.

RideHub; VTHacks | JavaScript, React Native, HTML/CSS, Swift

- Within the span of 36 hours and a team of four, designed and developed an iPhone/mobile application that compares the prices between Uber and Lyft, eliminating the need to switch between both applications.
- Implemented the usage of Gemini AI, Google's Distance Matrix API, Google Map API, Directions API, and Map Platforms API to display our map and calculate the pricing between Uber and Lyft.
